公司简介

Company Introduction

西索润滑技术有限公司，是一家专业研发、生产与销售集中润滑系统和液压设备的高新技术企业，公司生产的集中润滑系统具有稳定性高、可靠性强、密封性好、输出压力高等特点，现销售的产品和服务已覆盖石油化工、风力发电、农业机械、工程机械、轨道交通、医药等行业，是行业内领先的方案解决供应商。

公司秉承“诚信为本，质量第一，用户至上，不断创新”的理念，为客户提供A+的理想解决方案，来满足客户的不同需求，通过多年的研究及生产实践，从产品设计、配件选择、产品组装、成品测试及销售服务方面，保证产品品质。

Yantai CISO Lubrication Technology Co., Ltd. is a high-tech enterprise specializing in R&D, production and sales of centralized lubrication systems and hydraulic equipment. The centralized lubrication systems produced by our company have the characteristics of high stability, strong reliability, good sealing, and high output pressure. The products and services currently have covered petrochemical, wind power generation, construction machinery, agricultural machinery, rail transit, medicine and other industries, and it is a leading solution provider in the industry.

The company adheres to the concept of "integrity-based, quality first, and continuous innovation" to provide customers with A+ ideal solutions to meet the different needs of customers. Through years of research and development and production practice, from product design to accessories selection , product assembly, finished product testing and sales services, to ensure product quality.

递进式润滑系统 Progressive lubrication system

适用于润滑剂为稀油、流动脂、脂的高压大型系统
For oil, fluid grease and grease lubrication system

特点

- 结构紧凑、拓展容易
- 可加载检测功能
- 管路通畅无残留
- 宽剂量范围
- 分配器内部集成单向阀

Characteristic

- Compact, flexible kit
- Monitored function
- Channels flow through completely
- Wide range of use
- Integrated return valve inside

系统组成

- Screwed fittings
- Control and monitoring devices

功能原理

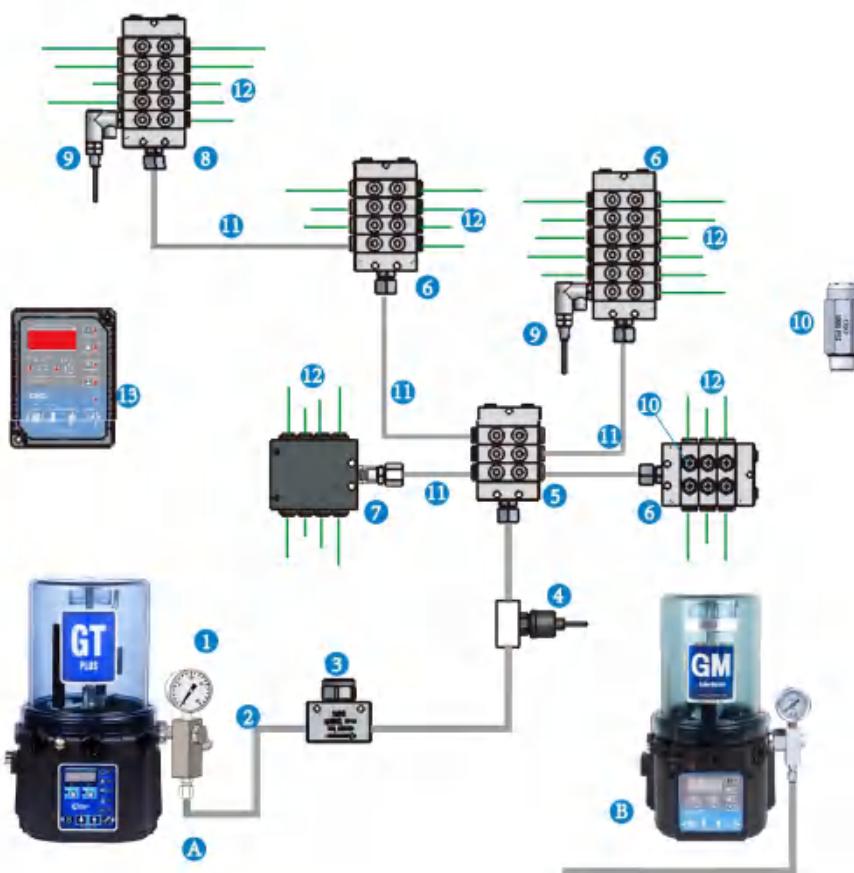

泵使润滑剂从主管路，流向各级递进式分配器，“递进式”的输送到各个润滑点。
递进式分配器的工作循环由目视或者电子控制系统来监控

The function

The lubricant is pumped through the main lines to the progressive distributor with the pump.
The lubricant is delivered "progressively" to the friction point.
The circulation of a progressive distributor is monitored optically or electrically.

递进式润滑系统概述 Progressive lubrication system description

1. 结构和设计原理 Construction and design:

递进式润滑系统由润滑泵和多个递进式分配器组成。分配器配备一个循环监控器。后面连接必要的管路、管衔接件和固定元件。压力监测指示器安装在每个递进式的分配器入口处，对功能控制更加有保障。

The progressive lubrication system comprises a feed pump and progressive distributors, whereby, the distributor is equipped with a circulation control . In addition there are the necessary pipelines, threaded pipe fittings and fastening components. Pressure indicator in the inlet of the respective progressive distributor, are additionally helpful for function control.

系统的设计取决于要连接的润滑点的数量和润滑脂剂量的要求。如果一个分配器不能满足所有的润滑点，那么就必须设计一个分配器作为主分配器，主分配器连接次级分配器，整个系统最多可以有三级分配器。

The design of the system depends on the number of lubrication points to be connected and the grease dose requirements. If a distributor cannot meet all the lubrication points, then a distributor must be designed to act as a primary distributor, and the primary distributor is connected to the secondary distributor, and the whole system can have up to three levels of distributors.

润滑泵安装在机器上较易触及的地方，这样才可能适时方便地为润滑泵油箱注油。递进式分配器则要尽可能接近润滑点。

The lubrication pump should be assembled on an easily accessible position of the machine, so that uncomplicated refilling of the container is possible. The progressive distributor should be assembled as close to the lubrication points as possible.

管路的设计必须能够承受最大泵压，最好使用钢管。如果有需要移动的润滑点，需使用适合尺寸的高压软管，长度尽可能地短，以保证剂量准确。因为软管高压下会膨胀，增加管路对润滑剂的损耗，致使短暂剂量不能保证。缩短高压软管的使用，还可以避免快速高压对润滑剂产生的负面反应。

The line system must be designed such that it can take maximum pump pressure. Preferably steel pipes are laid. If mobile lubrication points are to be lubricated, high pressure hoses of appropriate dimension must be used. The length of the high pressure hoses should be kept as short as possible, as these expand under pressure and can intake appropriate lubricant quantity. Timely secure feeding of the lubricant is thus no longer guaranteed. Shortening the use of high pressure hoses can also avoid the negative reaction of rapid high pressure to the lubricant.

2. 工作模式 Mode of action:

泵将润滑剂注入主管路、各级分配器、管路，直至润滑点。计量元件控制润滑剂的剂量，系统内集成监控元件。例如，分配器不工作、或由分配器内计量螺栓污浊失灵，可以由循环监控检测出来，系统报错，即循环监控在监控时间内无报告信号。

The lubricant is pumped into the main line by actuating the pump and fed to the connected progressive distributor. The lubricant is distributed over the number of outlets of the distributor and then delivered to the lubrication points or fed to another downstream progressive distributor, divided there and dispensed to the connected lubrication points. Dosing is done as per the selection of the dosing elements with different flow rates.A circulation control detects every circulation of the system. If a progressive distributor cannot deliver its lubricant or if a piston is blocked e.g. due to contamination, the system reports fault i.e. the circulation control has not reported within the monitoring time.

递进式润滑系统概述 progressive lubrication system description

3.启动 Start-up:

启动前，必须用洁净的注油装置或者注油桶泵向泵内注油。确保注油过程中没有气泡。润滑泵配置随动活塞，来保证润滑剂的清洁无气。接下来依次给泵和递进式分配器排气，连续泵出润滑剂直至无气的润滑剂流出，至主分配器所有出口，再至各级分配器。

Before start-up, the pump must be filled with clean grease without any air bubbles. It is important that the pump is filled using a filling or barrel pump. The barrel pumps must be equipped with follow up piston. Clean and air-bubble-free filling can thus be ensured. A cartridge pump with pre-filled cartridges may also be used for small consumption quantities.

Then the pump and subsequently the progressive distributor must be ventilated. Pumping follows till bubble-free lubricant appears first on the pump and then on all the outlets of the main distributor and subsequently on the downstream progressive distributors.

特别是对于使用润滑脂的大型设备润滑系统，需要从润滑点、递进式分配器至泵分别填充洁净润滑剂，由此测定系统各部分的压力。保证润滑剂及时补充添加，避免系统进气，否则系统需要重新排气。

Particularly for large systems, which are operated with grease, it is essential to start the system step-wise from the lubrication point to the pump i.e. lubrication points, lines and progressive distributor must be pre-filled individually. The pressure requirement of individual segments of the system can thus be checked directly. Pay attention that the lubricant is refilled on time, for preventing air bubbles in the system. Else the complete system must be re-ventilated.

4.安装 Assembly:

递进式分配器的安装表面必须平坦，这样在栓紧时外壳不会变形。有需要的话，可以使用垫圈来校准。

递进式分配器的所有出油口必须保持通畅。确保绝对的洁净，泵、递进式分配器、特别是管路及连接件必须在安装前清洁完毕。

The fastening surface of the progressive distributor must be plane, so that the housing is not braced while screwing. If required, washers may be required for alignment. Outlet bore of the progressive distributor must be closed. Cleanliness must be observed. Pumps, progressive distributor and particularly the pipelines and fittings must be cleaned thoroughly prior to the assembly.

5.润滑剂 Lubricant:

一般来讲，递进式润滑系统选用矿物脂作为润滑剂，粘度高于265 (1/10mm) , NLGI-000-2.如非必要，尽可能不要使用混合油脂。如必须使用混合油脂，则需保证同属一类矿物皂基。

Generally, grease can be dispensed based on mineral oil that shows a walk penetration more than 265 (1/10 mm), NLGI-Klasse 000 - 2 in the bielomatik progressive lubrication system. Greases must not be mixed. In exceptional case.

6.维修保养及故障检修 Maintenance:

定期检查系统的密封性和油箱储量

若循环监视器响应，原因可能是：

- a) 油箱或各个油桶无油
- b) 泵未排空或者故障
- c) 系统由于高压产生堵塞

递进式润滑系统概述 progressive lubrication system description

- 润滑管路不通
- 润滑点及附近管路不通
- 随意关闭递进式分配器的某些出油口
- 递进式分配器的活塞卡住 (变形或污损)
- 递进式分配器中的导管关闭
- 递进式分配器中所有的活塞处于中位

如果系统产生堵塞，故障可能出现在系统的很多地方。堵塞处会过压，栓销会凸出，由此来定位分配器附近的堵塞点。

Impermeability of the system and the container fill level must be checked at regular intervals. A fault occurs if the circulation control has not responded within the monitoring time.

Reasons:

- a) Container or barrel empty.
- b) Pump not ventilated or defective.
- c) System blocks at high pump pressure.
- Lubrication line closed
- Lubrication point or its channel closed
- Outlet on the progressive distributor closed

unauthorised

- Piston in the progressive distributor fits tightly (bracing, contamination)
- Channel within the progressive distributor closed due to contamination.
- All pistons of a progressive distributor are at centre position.

In case the system is blocked, fault may occur at any location in the system. There is overpressure at the blocked location, which is signalled to the relevant pressure indicator by a protruding pin. Source of fault can thus be localised on a secondary distributor.

整体式无泄漏高压分配阀**Single block progressive distributor valve**

DSP是一种单块式递进分配器，是狭窄空间的最好选择。

有6, 8, 10, 12, 14, 16 ,18, 20和22个出口各款产品可供选择，每个出口流量0.2 cm³/循环(0.01 in³/循环)

The DSP is a single block progressive divider valve that is ideal for applications where space is limited.

It is available in 6,8,10,12,18,20 and 22 outlet versions, each with an output of 0.2 cm³ inch per cycle.

任意出口在安装堵头后可以和相邻的下一个出口相连，实现流量叠加。

An outlet can also be merged with the sequential outlet on the block by removing the special outlet fitting and installing a plug.

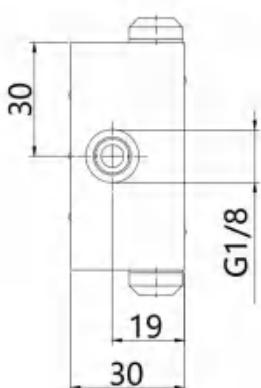

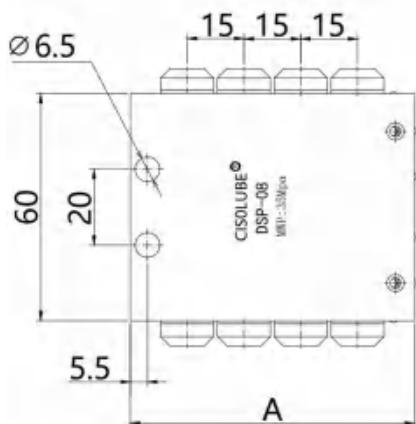

通过移走一个堵头，换成目视或者电子监控装置，可以实现目视或电子监控.油脂被泵入计量阀后，递进式计量阀中柱塞依次动作，等量地将油脂分配到每一个出口。

Visual or electronic monitoring can be achieved simply by removing a plug and installing a visual or electronic add-on device as shown below. The spools in a progressive metering valve operate sequentially partitioning equally across the outlets, the grease being pumped into the metering block inlet.

泵入阀体内部的润滑脂由递进式活塞均匀地分配给每个出口。如果一个润滑点被堵，所有点将停止工作，从而让用户用一个监控装置就可以监控整个系统。

The grease pumped inside of the block is distributed by the piston dispensers of the progressive dosing device equally among the different outputs. In case a single output becomes blocked, the pistons stop their activity allowing for the control of the entire system by means of a single device for this purpose.

Metering elements for progressive distributor of oil and grease

一组典型的VB分配阀包含一片“首片”、一片“尾片”和3至10片工作片组成。可以提供3至20个润滑点的润滑，VB分配阀的工作片，有各种规格的排量以供选择。双出口工作片（在工作片的规格数值后，用T表示双出口），有两个出油口，可以设定为侧面或者上方输出；单出口（在工作片规格数值后，用S表示单出口），有一个出油口，它可以在工作片的任一端，而另一端需要堵塞。注意双出口工作片不能堵塞任一出口，否则会影响正常工作。

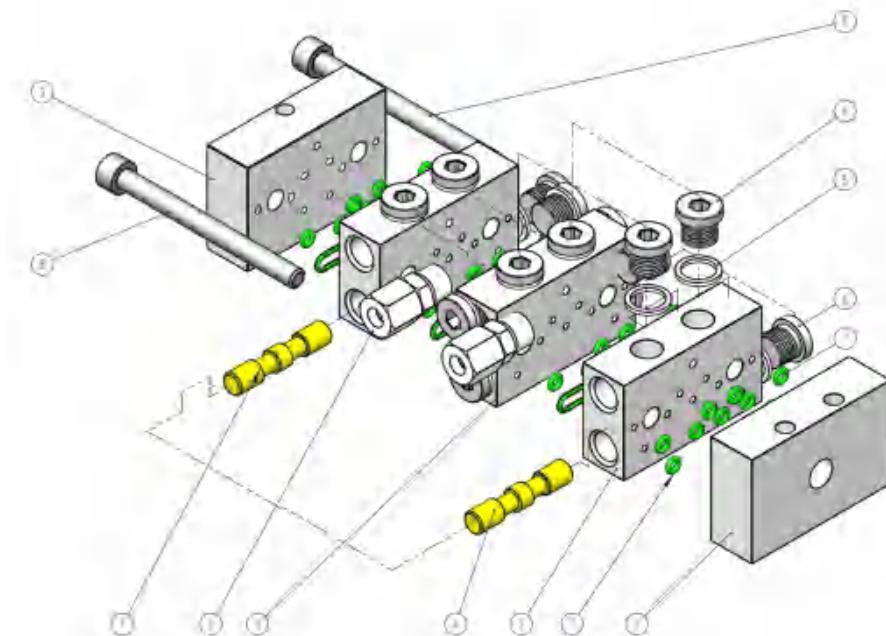

A typical VB distributor valve consists of a "first piece", a "tail piece" and 3 to 10 working pieces. Can provide 3 to 20 lubrication points of lubrication, VB distributor valve working piece, a variety of specifications of displacement for selection. The double outlet working piece (after the specification value of the working piece, the T represents the double outlet) has two oil outlets, which can be set as the side or upper output; the single outlet (after the specification value of the working piece, the S represents the single outlet) has one oil outlet, which can be at either end of the working piece, and the other end needs to be blocked. Note: that the double outlet working piece should not block any outlet, otherwise it will affect the normal operation.

可以轻松配置磁性和电子接近开关循环指示器，为成功润滑提供积极保障

DXF 分配器

用于润滑油和润滑脂的逐步输送润滑

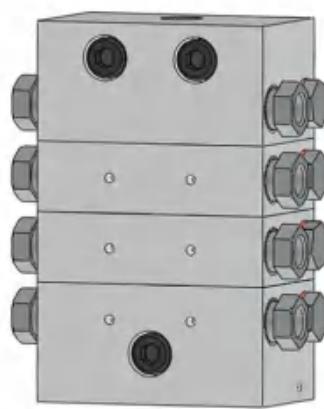

最大工作压力 - 4350psi (300 bar, 30 MPa)

DXF分配器 DXF distributor

适用于稀油和油脂分配的计量元件，通过递进式柱塞运动将润滑剂输送至每个出油口。外形紧凑而坚固，灵活性高，适合多种应用，小巧的体积，能够在空间狭小的空间动作。

Suitable for measuring element distributor of thin oil and grease, through progressive type plunger movement type lubricant to each of the oil outlet. Appearance is compact and strong, high flexibility, suitable for a variety of applications, small form-factor, narrow space movements in space.

DXF分配器至少由三个元件组成，一个首片，一个中间片和一个尾片组成，可以提供3至24个润滑点的润滑。有多种规格的排量以供选择。每个出油口均可进行并联，实现出油量翻倍增加。

DXF distributor is composed of three elements, at least a first block, a middle block and an Tail block, can provide 3 to 24 lubrication point of lubrication. There are many sizes of displacement to choose from. Each oil outlet can be carried out in parallel, double oil quantity increase.

可以轻松配置机械和电子传感器，为成功润滑提供积极保障。

Mechanical and electronic sensors can be easily configured to provide positive assurance for successful lubrication.

对于需要在紧凑坚硬的空间内精确分配中小型润滑剂量的润滑应用，西索的DXF递进式分配器是非常理想的解决方案。

CISO's DXF progressive distributor is the ideal solution for lubrication applications that require the precise distribution of small and medium lubrication doses in a compact, rigid space.

特性 Characteristics

- 阀体表面采用镀锌镍处理方式，具备优秀的耐腐蚀能力

The surface of the valve body is treated with galvanized nickel, which has excellent corrosion resistance

- 紧凑性使其尤其适合用于有限空间

Compactness makes it particularly suitable for use in confined Spaces

- 可对分配器的工作状态进行实行监控

The working status of distributor can be monitored

- 模块化设计灵活，维护简单

Modular design is flexible and easy to maintain

- 坚固耐用，可在恶劣环境下高效运行

Rugged and efficient operation in harsh environments

工作原理 Operating principle

1

压力使柱塞1（蓝色）向左移动，推动油脂，使油脂（黄色）从B点排出。

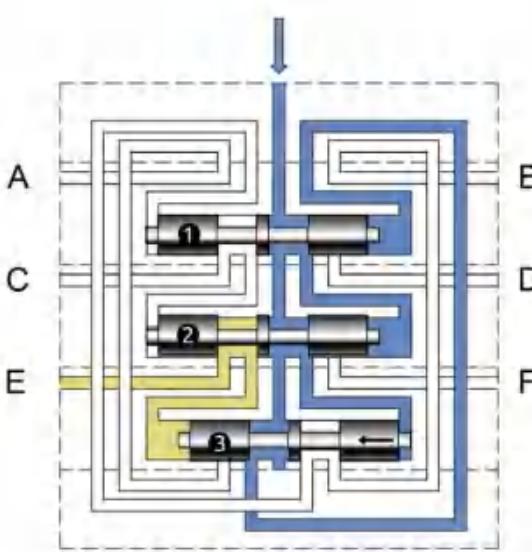

Lubricant flow pressure (blue) moves piston 1 to the left allowing lubricant discharge (yellow) from B.

2

当柱塞1达到极限时，油脂在压力（蓝色）的作用下涌于柱塞2，油脂（黄色）从C点排出。

When piston 1 reaches its limit, lubricant flow pressure (blue) operates on piston 2. Lubricant volume (yellow) discharge from C.

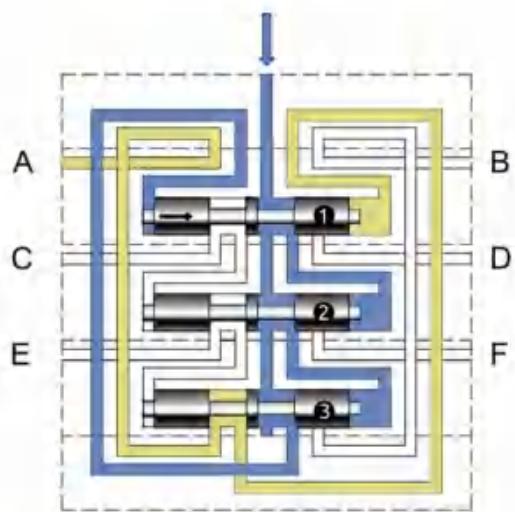

3

当柱塞2达到极限时，压力（蓝色）涌向柱塞3。油脂（黄色）从E点排出。

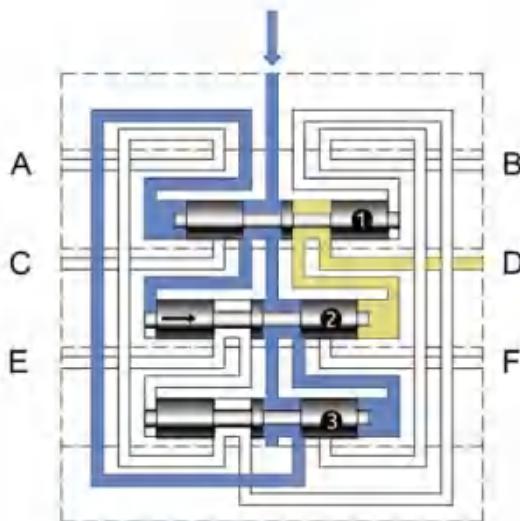

When piston 2 reaches its limit, lubricant flow pressure (blue) operates on piston 3. Lubricant volume (yellow) discharge from E.

4

当柱塞3达到极限时，压力（蓝色）涌向柱塞1。油脂（黄色）从A点排出。

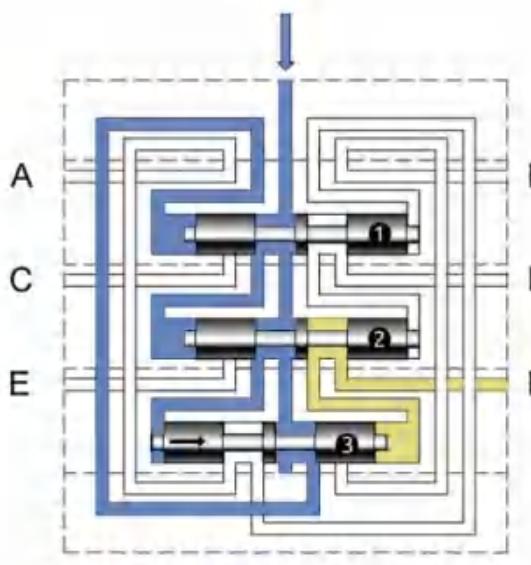

When piston 3 reaches its limit, lubricant flow pressure (blue) operates on piston 1. Lubricant volume (yellow) discharge from A.

当柱塞1达到极限时，油脂在压力（蓝色）的作用下涌于柱塞2，油脂（黄色）从D点排出。

When piston 1 reaches its limit, lubricant flow pressure (blue) operates on piston 2. Lubricant volume (yellow) discharge from D.

5

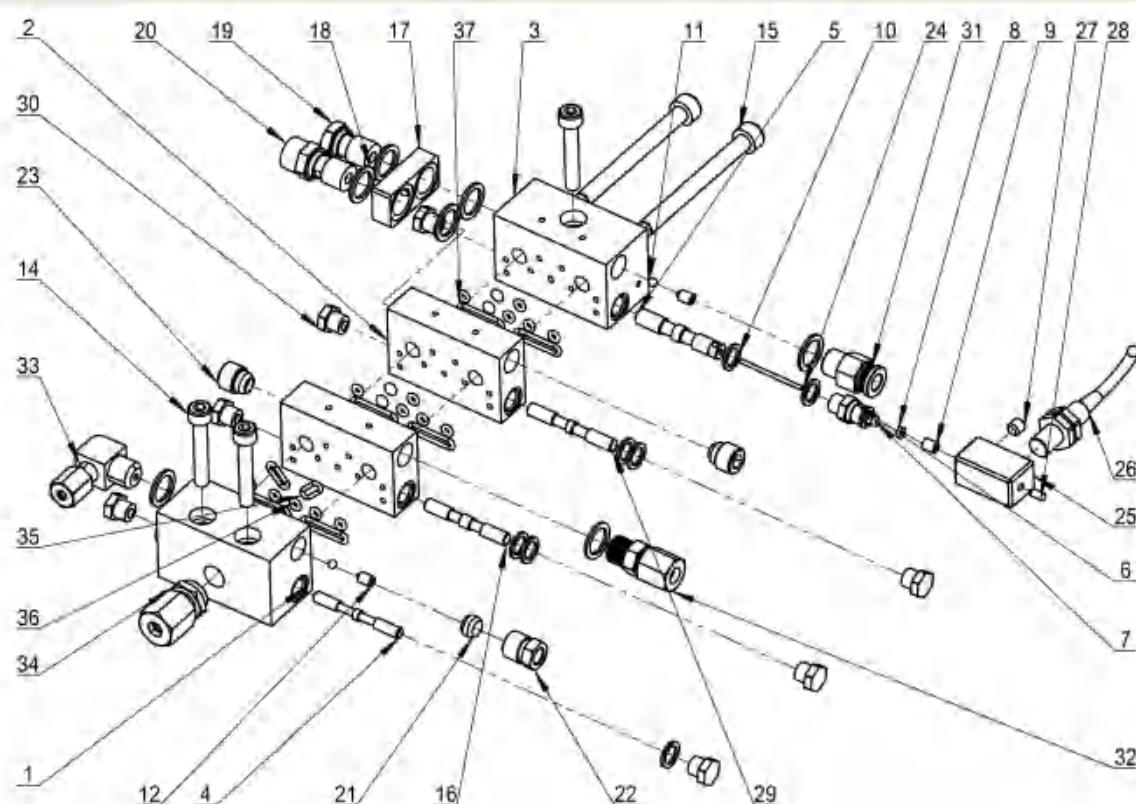

当柱塞2达到极限时，压力（蓝色）涌向柱塞3。油脂（黄色）从F点排出。系统准备进入新的循环。

When piston 2 reaches its limit, lubricant flow pressure (blue) operates on piston 3. Lubricant volume (yellow) discharge from F. The system is ready for a new cycle.

VSP 分配器

VSP 模块化分配器
排量精准

最大压力 25Mpa

VSP模块化递进分配阀

VSP modular distributor valve

西索VSP 模块化分配阀能够保证精确的润滑，并且适用于各种苛刻工况，是一款完美的润滑剂分配解决方案。

VSP modular distributor valve can ensure accurate lubrication, and is suitable for all kinds of harsh conditions, is a perfect lubricant distributor solution.

分配器分为两个主要部件：

- 底板 (至少由三个元件构成)
- 分配阀 (有单出口和双出口版本)。

The divider consists of two main parts:

- THE BASE (consisting of a minimum of three elements)
- THE METERING VALVES (available with both a single outlet as well as a double one)

为了最大化设备的性能，可以使用电子监控元件来检测系统是否发生故障或受阻。

To maximize the performance of the plant, it is crucial to use electrical monitoring elements that detect malfunctioning or system blockage.

由于系统具有良好的模块化性质，因此能够很方便地进行扩展，更改分配器元件时也不需要拆解润滑管路，确保了更快的相应速度和更低的维护成本。分配器的模块化能够根据设备的需要对润滑点进行分组。

Thanks to its modularity, the system can be easily expanded and replacement of metering elements can occur without removing the pipework, thereby guaranteeing low maintenance costs. The modularity of the dividers furthermore allows you to bundle lubrication points according to system requirements.

典型应用：

汽车、工业设备、风电、工程机械等

Typical applications: automobile, industrial equipment, wind power, construction machinery, etc

模块式整体提供、为客户节约装配时间
